Online Food Delivery Management System

Report 1: Project Description Report

Business Idea: An online food delivery system that connects customers with restaurants and delivery drivers. Customers can browse menu items, place orders, make payments, and receive deliveries.

1. Problem Statement

Customers may find it difficult to order food efficiently, while restaurants need a structured way to manage menu items and customer orders. Delivery drivers also need clear delivery information. The proposed system provides one information system to coordinate these activities.

2. Purpose

The purpose of the system is to manage the main activities of online food ordering: customer registration, restaurant and menu management, order processing, payment recording, and delivery management.

3. Project Scope

Included: customer information, restaurant information, menu items, order creation, order items, payment records, delivery records, delivery-driver assignment, and order/delivery status updates.

Excluded: implementation of a real mobile/web application, real payment-gateway integration, GPS navigation, advanced restaurant analytics, and automated financial accounting. This assignment focuses on modelling the proposed system with UML.

4. Main Classes and Responsibilities

Class	Responsibility
Customer	Stores customer details and supports registration and order placement.
Restaurant	Stores restaurant details and manages menu items and incoming orders.
MenuItem	Represents food items, prices, and availability.
Order	Represents a customer's food order and its status and total.
OrderItem	Represents individual menu items and quantities within an order.
Payment	Records payment information and payment status for an order.
Delivery	Stores delivery address, date, and delivery status.
DeliveryDriver	Stores driver information and manages assigned deliveries.

5. Brief System Requirements

The system should allow customers to register and place orders; restaurants should manage menu items and accept orders; orders should contain one or more order items; each order should have a payment record and a delivery record; deliveries should be assigned to a delivery driver and updated as they progress.
